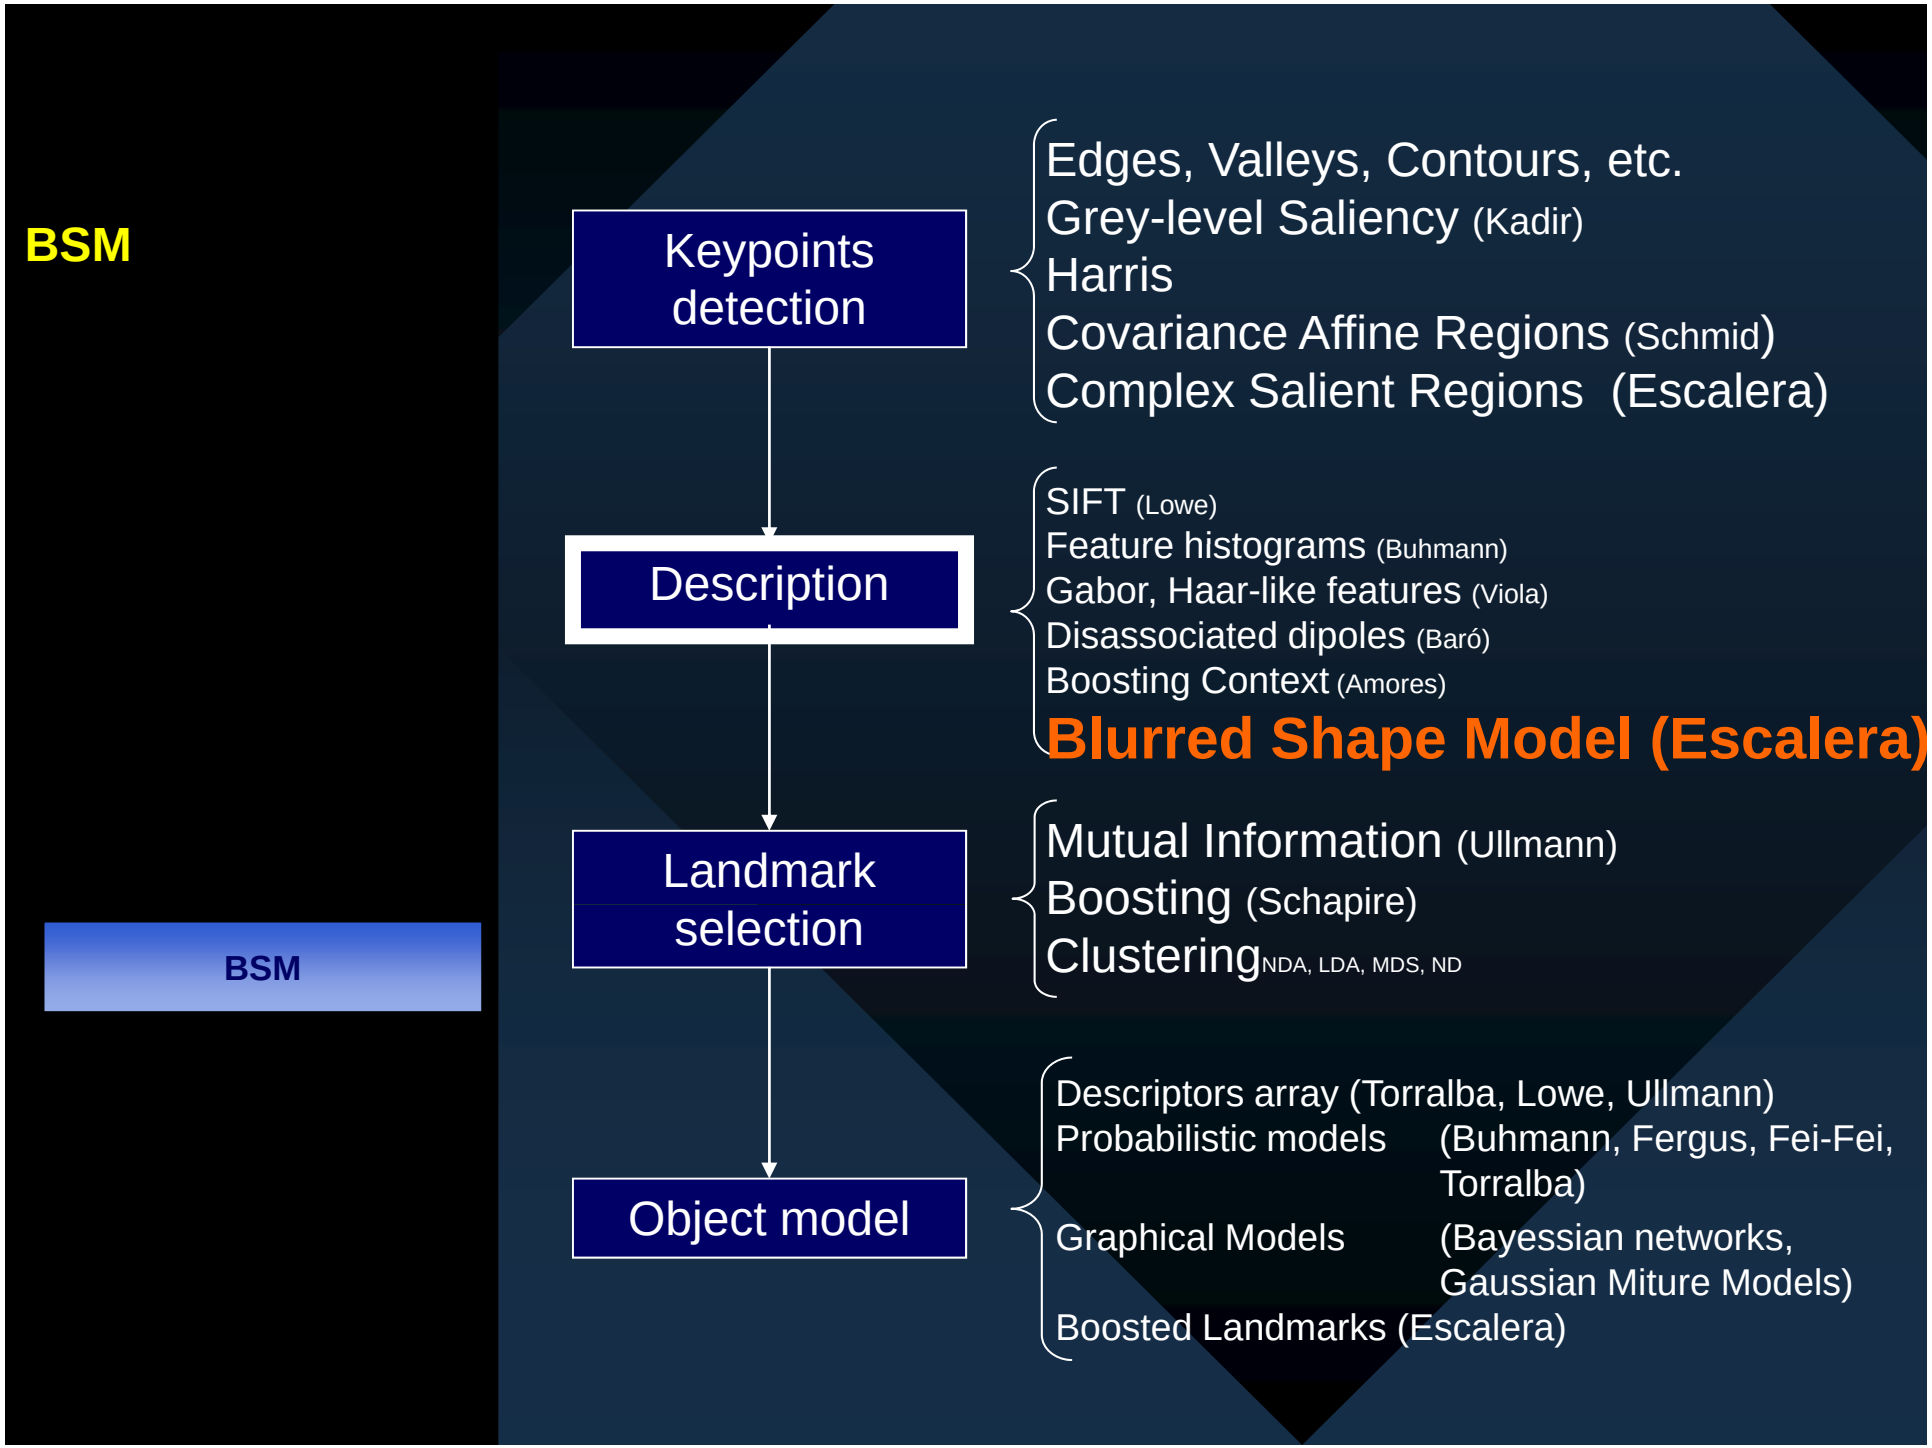
Blurred Shape Models



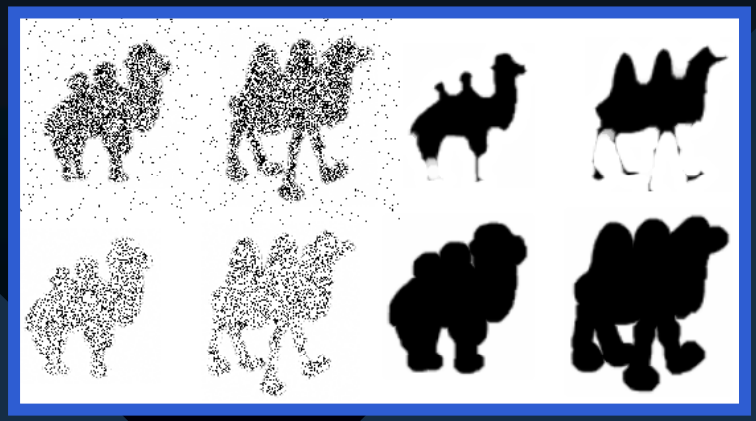
BSM
Keypoints detection
Edges, Valleys, Contours, etc.
Grey-level Saliency (Kadir)
Harris
Covariance Affine Regions (Schmid)
Complex Salient Regions (Escalera)
Description
SIFT (Lowe)
Feature histograms (Buhmann)
Gabor, Haar-like features (Viola)
Disassociated dipoles (Baró)
Boosting Context (Amores)
Blurred Shape Model (Escalera)
Landmark selection
Mutual Information (Ullmann)
Boosting (Schapire)
Clustering NDA, LDA, MDS, ND
Object model
Descriptors array (Torralba, Lowe, Ullmann)
Probabilistic models (Buhmann, Fergus, Fei-Fei, Torralba)
Graphical Models (Bayessian networks, Gaussian Miture Models)
Boosted Landmarks (Escalera)
BSM

BSM

Multi-class binary object classification

- Rotation,
- Partial occlusions,
- Noise,
- Rigid and elastic deformations,
- Intra-class and inter-class variabilities,
- …

BSM



BSM

Algorithm

Given a binary image I,
Obtain the *shape* S contained in I

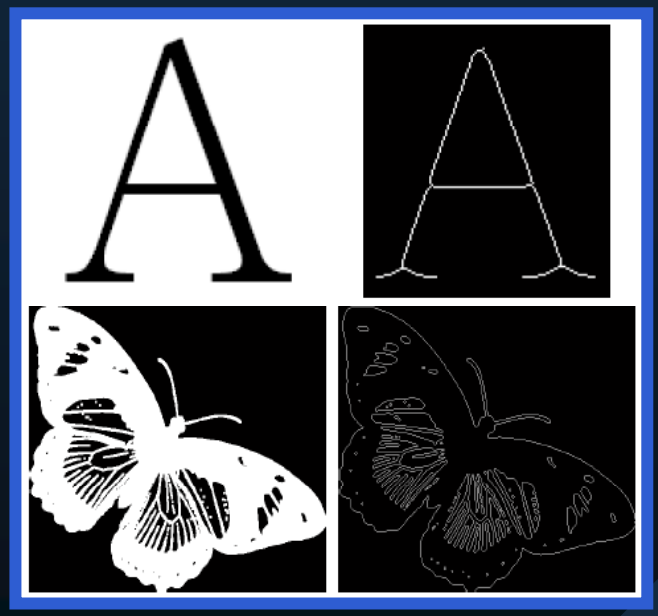
Object Shape

Grid

Points distances

Updating histogram

BSM PDF



- Determine shape:
- Contour map
- Skeleton
- …

BSM

BSM

Algorithm

Object Shape

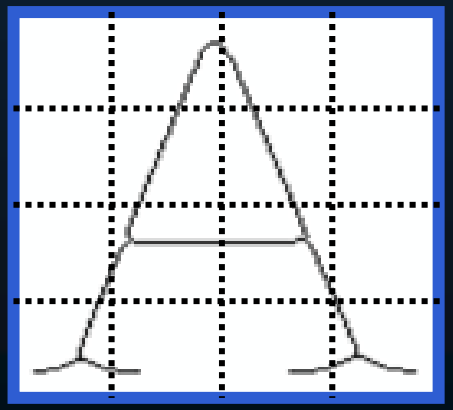
Grid

Points distances

Updating histogram

BSM PDF

Divide I in $n \times n$ equal size sub-regions $R = \{r_i, ..., r_{n \times n}\}$, with c_i the center of coordinates for each region r_i.
Let $N(r_i)$ be the neighbor regions of region r_i, defined as $N(r_i) = \{r_k | r \in R, ||c_k - c_i||^2 \leq 2 \times g^2\}$, where g is the cell size.



- *nxn* grid size

BSM

BSM

Algorithm

Object Shape

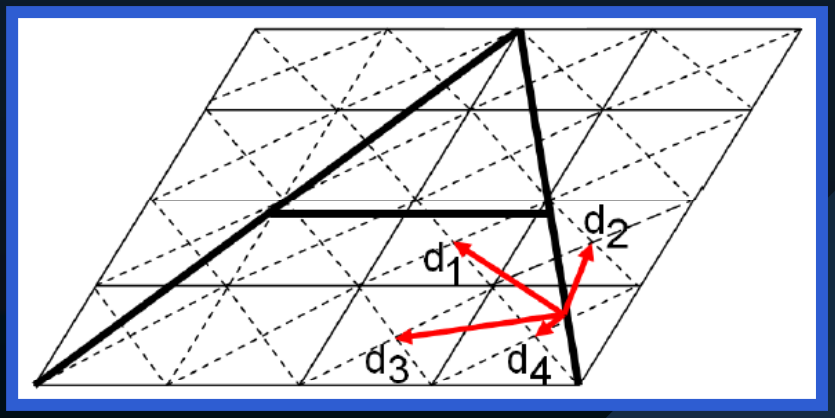
Grid

Points distances

Updating histogram

BSM PDF

For each point $\mathbf{x} \in S$,
  For each $r_i \in N(r_{\mathbf{x}})$,
    $d_i = d(\mathbf{x}, r_i) = ||\mathbf{x} - c_i||^2$
  End_For



- Distances to the nearest centroids

BSM

BSM

Algorithm

Object Shape

Grid

Points distances

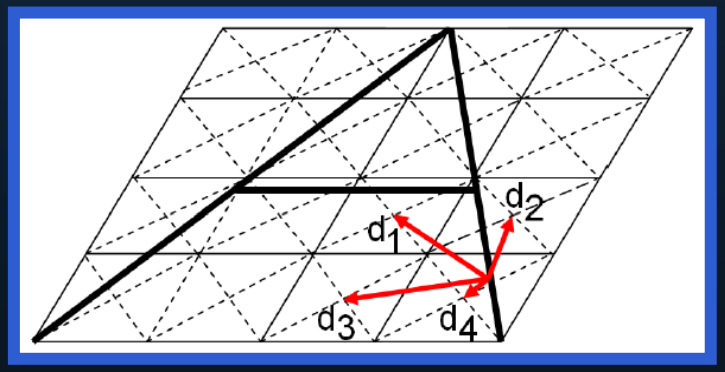
Updating histogram

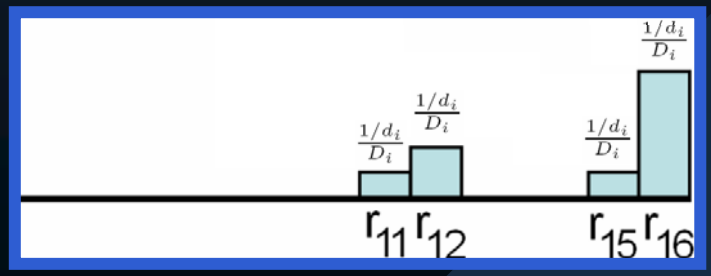
BSM PDF

Update the probabilities vector v positions as:

$v(r_i) = v(r_i) + \frac{1/d_i}{D_i}, \quad D_i = \sum_{c_k \in N(r_i)} \frac{1}{||\mathbf{x} - c_k||^2}$

End_For





- Spatial distribution of points

BSM

BSM

Algorithm

Object Shape

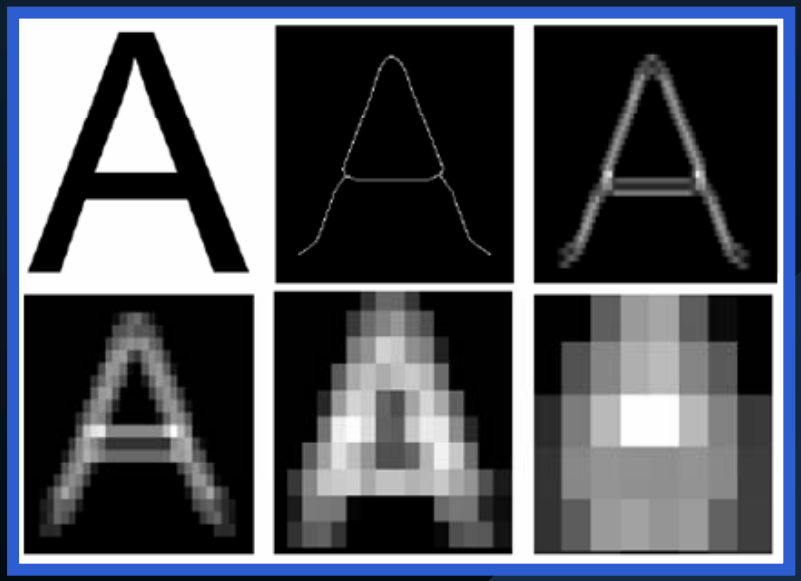
Grid

Points distances

Updating histogram

BSM PDF

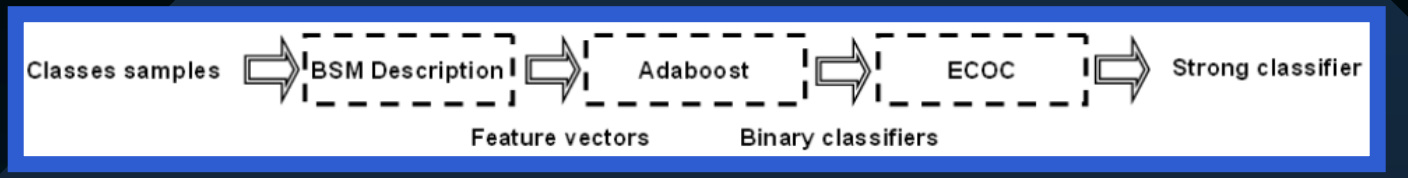
Normalize the vector v as: $v = \frac{v(i)}{\sum_{j=1}^{n^2} v(j)} \forall i \in [1, ..., n^2]$



•BSM for different grid sizes

BSM

BSM

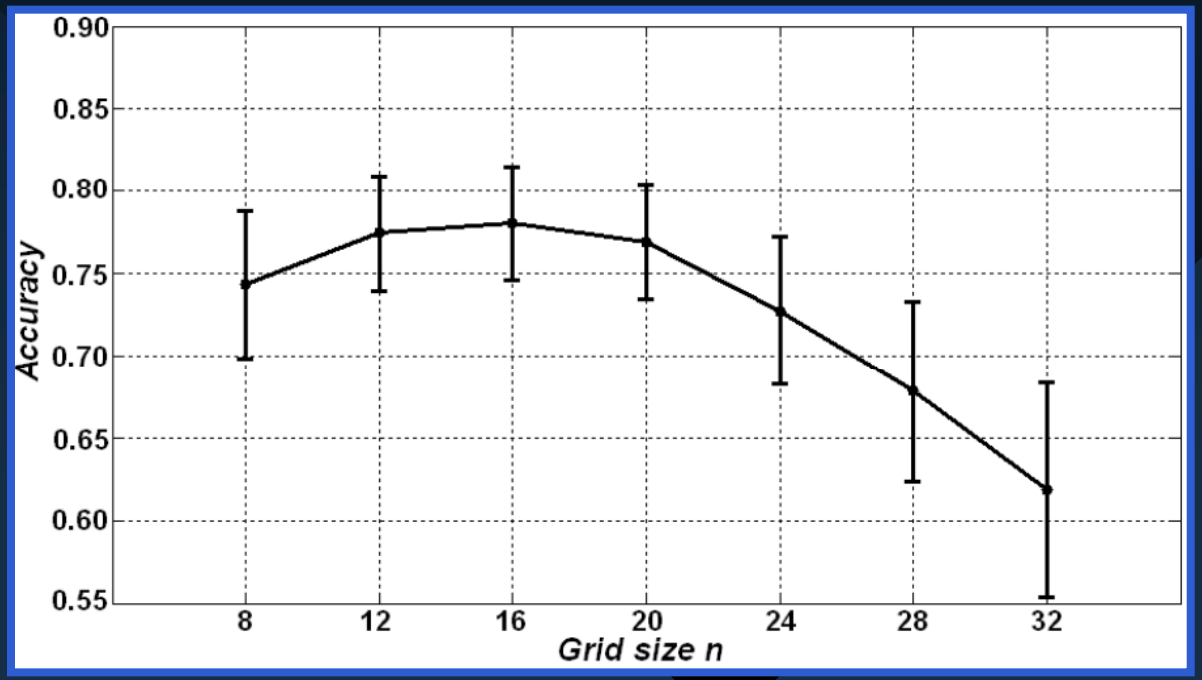


•The method is scaling and stretching invariant.

•The BSM descriptor is robust against rigid and elastic deformations.

→ Cross-validation → optimum grid size

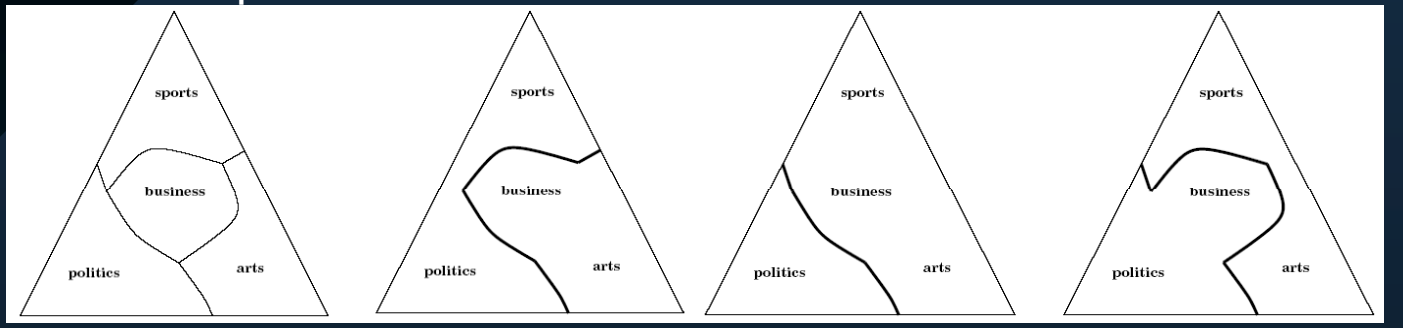
BSM



ECOC CODING

BSM

Example	Classifier 1	Classifier 2	Classifier 3



C1= sports	1	1	1
C2=business	-1	1	-1
C3=politics	1	-1	-1
C4=arts	-1	1	1

BSM

C1= sports
C2=business
C3=politics
C4=arts

coding matrix

1	1	1
-1	1	-1
1	-1	-1
-1	1	1

Coding

One-vs-one

One-vs-all

Dense Random

Sparse Random

Decoding: Given a test sample, we obtain a code according to the output of each classifier and find the “closest” code.

-1 1 1

BSM

ECOC DECODING

Decoding

Hamming decoding

Euclidean decoding

Loss-based decoding

1 versus All

Code length: Nc

1	-1	-1
-1	1	-1
-1	-1	1

Three symbol codes

1 versus 1: “All pairs”

Code length: Nc (Nc-1)/2

1	1	0
-1	0	1
0	-1	-1

Random Dense ECOC

Code length: 10 log Nc

1	-1	1
-1	1	-1
1	-1	-1

Random Sparse ECOC

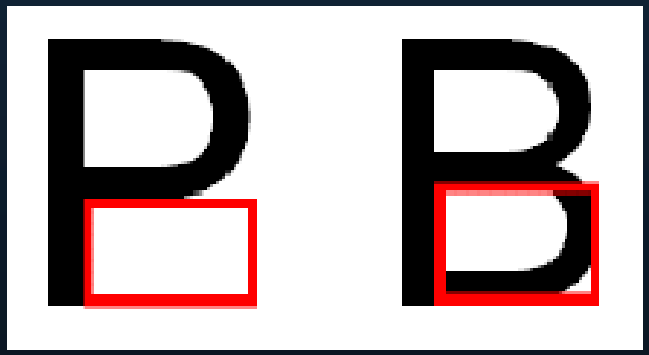
Code length: 15 log Nc

1	0	-1
-1	1	0
0	-1	1

BSM

BSM

•Adaboost learns difficult classes which may share features.



BSM

•The multi-class ECOC framework can correct possible classification errors produced by the binary classifiers.

•When the classifiers are trained only few features are selected

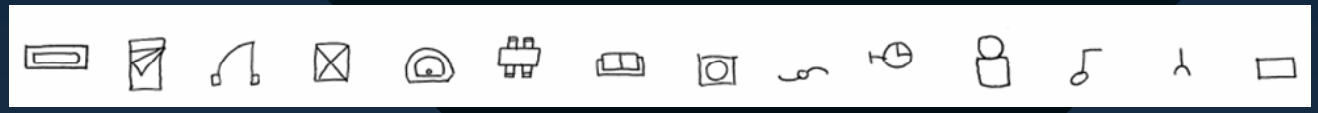
→ Fast and suitable for real-time categorization problems.

BSM

Evaluation data

•Clefs database: collection of modern and old musical scores (19th century) of the Archive of the Seminar of Barcelona. The database contains a total of 2128 samples between the three different types of clefs from 24 different authors.

BSM



•Architectural hand-drawn symbols database: 2762 total samples organized in 14 classes. Each class consists of an average of 200 samples drawn by 13 different authors.
